

# EWM-P-AA

## DIGITAL CARD FOR PRESSURE AND FORCE CONTROL IN CLOSED LOOP SYSTEMS SERIES 10

**RAIL MOUNTING TYPE:  
DIN EN 50022**

### OPERATING PRINCIPLE

### TECHNICAL CHARACTERISTICS

|                                                                            |         |                                                                                 |

## 1 - IDENTIFICATION CODE

This module is useful for pressure control in very different applications. The output signal can control various kind of pressure valves, but the controller structure is optimized for pressure closed loop control system with typical pressure valves. An integrated power stage and high dynamic control loops (1 msec for pressure control and 0,167 msec for the current loop control) offers a simple solution.

This module is recommended where open loop applications are not sufficient concerning the accuracy.

Pressure controls with constant pumps or remote controllable servo pumps and for force and torque controls with cylinders and motor drives are typical applications.

## 2 - FUNCTIONAL SPECIFICATIONS

### 2.1 - Power supply

This card is designed for 12 to 30 VDC (typical 24 V) of a power supply. This power supply must correspond to the actual EMC standards.

All inductivities at the same power supply (relays, valves) must be provided with an over voltage protection (varistors, free-wheel diodes).

It is recommended to use a regulated power supply (linear or switching mode) for the card supply and for the sensors.

**NOTE: the value of the power supply voltage on the card must not be lower than the rated working voltage of the solenoid to be controlled.**

### 2.2 - Electrical protections

All inputs and outputs are protected against overvoltage and have filters.

### 2.3 - Digital Input

The card accepts digital input. The digital input must have a voltage from 12 to 24 V with current <0,1A. See the block diagram at paragraph 8 for the electric connections. As common: potential 0V (PIN 4) is used. Low level <4; High level >10V

### 2.4 - Command Input

The card accepts analogue command input, with voltage 0÷10V ( $R_i = 100\Omega$ ) and current 4÷20 mA ( $R_i = 390\Omega$ )

### 2.5 - Input feedback values

The card accepts analogue feedback input. The feedback value must be 0 ÷ 10V ( $R_i = 100\Omega$ ) or 4 ÷ 20 mA ( $R_i = 390\Omega$ ).

### 2.6 - Output values

The output current value for this card is settable via software, The available values are 1,0 - 1,6 and 2,6 A.

### 2.7 - Digital Output

A digital output is available (READY) and its signal is displayed from the green led.

## 3 - LED SIGNALS

There are two leds on the card, but only the GREEN one works.

GREEN: Shows if the card is ready.

ON - The card is supplied and the system is ready

OFF - No power supply or ENABLE non activated

FLASHING - Failure detected (solenoid or 4÷20 mA) only if the parameter SENS is ON.

YELLOW: No function.

## 4 - ADJUSTMENTS

On the EWM card family, the adjustment setting is possible only via software. Connecting the card to the PC, the software automatically recognises the card model, and shows a table (see example on next page) with all the available parameters, with their commands, the default setting, the measuring unit and an explanation of the command and its uses.

The parameters changes depending on the card model, and they are fully described in the *Overhaul manual*.

EXAMPLE OF PARAMETERS TABLE

| Commands                           | Parameter                                                                                                       | Defaults                                      | Units                           | Description                                                                                                                                                                                                                                                                                                    |

## 5 - INSTALLATION

The card is designed for rail mounting type DIN EN 50022.

The wiring connections are on the terminal strip located on the bottom of the electronic control unit. It is recommended to use cable sections of 0.75 mm<sup>2</sup>, up to 20 m length and of 1.00 mm<sup>2</sup> up to 40m length, for power supply and solenoid connections on version M2. For other connections it is recommended to use cables with a screened sheath connected to earth only on the card side.

### NOTE 1

To observe EMC requirements it is important that the control unit electrical connection is in strict compliance with the wiring diagram.

As a general rule, the valve and the electronic unit connection wires must be kept as far as possible from interference sources (e.g. power wires, electric motors, inverters and electrical switches).

In environments that are critical from the electromagnetic interference point of view, a complete protection of the connection wires can be requested.

## 6 - SOFTWARE KIT EWMPC/10 (code 3898401001)

The software kit includes a USB cable (2.70 mt lenght) to connect the card to a PC or notebook and the software.

During the identification all information are read out of the module and the table input will be automatically generated.

Some functions like baud rate setting, remote control mode, saving of process data for later evaluation are used to speed up the installation procedure.

The software is compliant with Microsoft XP® operating systems.

## 7 - WIRING DIAGRAM

### DIGITAL INPUT AND OUTPUT

- PIN 5** READY output:  
General operationally, ENABLE is active and there is no sensor error (by use of 4÷ 20 mA sensors). This output corresponds with the green LED.
- PIN 6** START Input:  
The controller is active; the external analogue command value is taken over.
- PIN 15** ENABLE Input:  
This digital input signal initializes the application. The analogue output is active and the READY signal indicates that all components are working correctly. The system works in open loop (like a simple power amplifier).

### ANALOGUE INPUT

- PIN 9/10** P-command (W)  
range 0 ÷ 100% corresponds to 0 ÷ 10V or 4 ÷ 20 mA
- PIN 13/14** P-feedback (X),  
range 0 ÷ 100% corresponds to 0 ÷ 10V or 4 ÷ 20 mA

### ANALOGUE OUTPUT

- PIN 3/4** PWM output for controlling of the valve.
